

Your team is developing advanced software for camera control, featuring two key functionalities:

- **Resolution and Image Magnification Synchronization:** Synchronizing digital zoom capability with image size to prevent pixelation and distortion in the displayed image.
- **Automatic Illumination Control:** Synchronizing exposure and brightness to ensure the displayed image is neither too dark nor too bright.

Resolution & Magnification Synchronization

When the resolution is set to its maximum level, the digital zoom function allows magnification up to the highest available value. Conversely, as the resolution decreases, the digital zoom capability becomes progressively more limited, with each reduction further constraining the zoom capability.

Similarly, when digital zoom is configured at its highest setting, the available resolution options are restricted to the maximum value. As the digital zoom level decreases, additional resolution options become accessible, with each decrease in zoom gradually expanding the range of selectable resolutions.

Auto Illumination

When the "Auto Illumination" feature is executed, the software automatically adjusts the brightness value based on the applied exposure settings. If exposure is set to the lowest value, brightness will be adjusted to the highest level, and vice versa. However, in cases where both parameters are set to their highest values, exposure will be adjusted to align with brightness.

You are tasked with designing comprehensive test cases based on the provided requirements and mockups. Follow the steps below to ensure a structured and effective approach:

- **Analyze software requirements** thoroughly to ensure all functionalities are accurately covered in the test scenarios.
- **Develop detailed test cases** based on the requirement documentation to evaluate key features and user interactions.
- **Establish a well-structured test case format** with clear and complete information to support systematic execution and validation.
- **Assign an importance level to each test case**, prioritizing them based on their impact on software quality and functionality.
